I have no medical expertise and I claim none. I am not offering any medical advice or diagnosis with the presentation of this information. I am acting solely as an independent researcher providing the results of extended observation and analysis of unusual biological conditions that are evident.

The following photographs are not pleasant to view and I would prefer to not have to present them. The magnitude of the issue demands that the information be made available to the general public. A method to remove at least a portion of the pathogenic forms that have been reported extensively on this site has been established. The method involves the use of red wine or a red wine-hydrogen peroxide mixture as an extended rinse for the mouth. Please see additional cautionary notes for the use of hydrogen peroxide within this report. Full and entire credit for the discovery of this method is to be given to Dr. Gwen Scott, N.D. and the public has a call to be grateful for the many unselfish contributions that she has made to the understanding of the "Morgellons" issue (please also see A Natural Medicine Approach on this site).

The use of the term "Morgellons" is a dubious approach as the pathogenic forms first discovered within a purported "Morgellons" subject are showing themselves to exist in equal form within the general public. To date, no human being is excluded from the findings of recent research through this site; hopefully exceptions to this case will soon be found. Thus far, fourteen individuals across numerous state lines have subjected themselves to the test method that is depicted on this paper. All fourteen produce and manifest the same physical forms through the gums of the mouth and only the amount of the material produced varies from individual to individual. The manifestation of skin conditions characteristic of the so-called "Morgellons" condition is not required to produce the result shown.

I state clearly again that the pathogenic forms under investigation are repeatedly showing up in the general population, regardless of whether certain "skin anomalies" are present or not. The pathogenic forms were, however, first discovered as a result of observation of the general population. The manifestation of this condition is individual...
Examination of these same skin anomalies. The segregation of only certain individuals as having the "Morgellons" condition is completely and totally false; the general population is involved whether they would like to know of it or not. The pathogens found have now been discovered repeatedly across all major body systems and functions, including skin, blood, hair, saliva, dental (gum), digestive, ear and urinary samples.

Gum-dental samples collected after extended wine-hydrogen peroxide mixture rinses of the mouth (e.g., 5 minutes each) and placed upon a glass slide for observation. Mouth brushed and cleaned to best degree possible prior to the test. Material emanates from the gums of the mouth; this individual produces a greater amount of material relative to other individuals. Foam appearance results from the peroxide. Core material is composed essentially of the four pathogenic forms that have been extensively described on this site (encasing filament, sub-micron filament network, Chlamydia-like structures and the "hybrid form"). Samples have repeatedly observed at extreme visible microscopic examination, i.e., 7000x; and they are generally consistent between various samples. One mixture that is under trial is 1/3 3% hydrogen-peroxide mixed with 2/3 dark red wine (e.g., merlot). Burgundy color results from stain of red wine. Another alternative under investigation is to limit the exposure to hydrogen peroxide by swabbing the teeth with peroxide prior to an extended rinse with red wine. Hydrogen peroxide is NOT to be taken internally. Sensitivity and reactions to peroxide may be of concern and an issue to consider. \textbf{NO THERAPY OF ANY KIND IS BEING RECOMMENDED WITHIN THIS REPORT; OBSERVATIONAL ANALYSIS ONLY IS BEING PROVIDED.} Identical pathogenic forms have now been found across most body systems and functions. The individuals involved have been found to have various forms of skin anomalies.
body systems and functions. The rinse test has in some cases been ongoing for 1-2 months; there continues to production of some material in most every case. Microscopic examination will be required for any final determination. On occasions, the test has been conducted several times in a row (e.g., 30-45 minute session of approx. 5 minutes each) with no cessation of material to date, although the amount appears to eventually decrease. It appears that the production of material can be correlated directly with the amount of time devoted to testing. The presence of the material also appears to be associated with a ear-blockage condition in one case. Not all individuals produce this amount of material and the sample may need to be examined very closely to determine if it exists; it usually appears as fibrous or stringy if present. The individual providing this sample does not demonstrate any outwardly visible "Morgellons" symptoms.

A similar gum-dental sample after drying and evaporation of the wine-peroxide mixture. Solid materials remain which form the basis of one of many recent analyses through this site.
One portion of the sample above observed at extreme visible magnification under the microscope. Dental-gum expelled sample. Sample extracted with use of hydrogen peroxide-red wine mix. (please refer to Pathogens & the General Population)

Three pathogenic forms visible: bounding filament (black border), sub-micron interior filament network (blue arrows) and Chlamydia-like organisms (red circles). Magnification approx. 7000x.
Microscopic examination of another gum-dental sample expelled from a separate individual using the wine-peroxide mixture.
An encasing filament and the Chlamydia-like structures are visible. In this individual the hybrid form is more common within the bounding filament as opposed to the sub-micron filament network.
Magnification approx. 3000x.

This method described above is not provided as a therapy or diagnosis of any kind; the reaction is being described from an observational point of view. Individuals are to consult with their own health practitioner for their health needs.

This website exists on a month-to-month contract. The existence of this website is not guaranteed. There is no known independent off site copy of this website. The public should preserve, protect and distribute the information on this site to their own level of confidence and assurance. Additional revisions may follow. Please distribute this information as rapidly and widely as is possible.
